# **DickensAssignmentValidator**

MUCEP Task 1 (Dr. Pierre-Paul Bitton)

Author: Shawon Ibn Kamal

Email: sikamal@mun.ca (mailto:sikamal@mun.ca)

## **Updates to exisiting program**

I made a few changes in the existing curator program to work with it efficiently and sorted out a few bugs. Here's the list:

- The files getting read from is renamed to "DataFiles" from "Files".
- The output csv files are being stored in a folder named "OutputFiles".
- Renamed "NotMatched.csv" to "MissingMeta.csv" in order to avoid confusion with "MissingFiles.csv".
- Stored the program in git, currently a private repo to me. I think it is a good way to track updates, we can work on it if you are interested
- Fixed few minor bugs in DickensAssignment.py program

```
In [290]: import pandas as pd
```

## Run DickensAssignment.py

```
In [291]: exec(open('DickensAssignment.py').read())
     4905 no. of files
     4093 match found
     812 match not found
     Complete
```

Compare OutputFiles with OutputFiles\_2020\_07\_14

```
In [292]: # Load old outputs
          df old result = pd.read csv('OutputFiles 2020 07 14/Result.csv', engine='python')
          df old missing files = pd.read csv('OutputFiles 2020 07 14/MissingFiles.csv', engine='python')
          df old not matched files = pd.read csv('OutputFiles 2020 07 14/MissingMeta.csv', engine='python')
          # Load new outputs
          df new result = pd.read csv('OutputFiles 2020 07 14/Result.csv', engine='python')
          df new missing files = pd.read csv('OutputFiles 2020 07 14/MissingFiles.csv', engine='python')
          df new missing meta = pd.read csv('OutputFiles 2020 07 14/MissingMeta.csv', engine='python')
          # Load filenames
          filenames = [name for path, subdirs, files in os.walk("DataFiles")
                       for name in files]
          df data files = pd.DataFrame({'filename':filenames}).sort values(by='filename')
          # Load template
          df template = pd.read csv('template.csv', engine='python')
          # Sort Result
          df new result = df new result.sort values(by='FileName')
```

```
In [293]:
          df diff result = pd.concat([df old result,df new result]).drop duplicates(keep=False)
          df diff missing files = pd.concat([df old missing files,df new missing files]).drop duplicates(keep=False)
          df diff not matched files = pd.concat([df old not matched files,df new not matched files]).drop duplicates(keep
          if (df diff result.size == 0):
              print("Results are the same")
           else:
              print("Results have ", df diff result.size, " differences")
          if (df diff missing files.size == 0):
              print("MissingFiles are the same")
           else:
              print("MissingFiles hav ", df diff missing files.size, " differences")
          if (df new missing meta.size == 0):
              print("NotMatchedFiles are the same")
           else:
              print("NotMatchedFiles have ", df_new_missing meta.size, " differences")
```

Results are the same
MissingFiles are the same
NotMatchedFiles have 812 differences

# Check to see if MissingMetaData entries are due to typo
